

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

of the introduced Ring-necked Pheasant, in which it is stated that hybrids between this species and the Sooty Grouse are of frequent occurrence. An attempt to domesticate the pheasants, it is said, has met with an encouraging degree of success.

The illustrations of this beautifully printed brochure include a colored plate of the male 'China Pheasant,' and the following half-tone plates: Peterson's Butte, where the pheasants were first liberated; a female 'China Pheasant'; its nest, full of eggs, and the same nest, with the egg shells after hatching; pheasant chicks; a view in the Willamette Valley, the home of the pheasants; a male Sooty Grouse; a hybrid — 'China Pheasant' + Sooty Grouse; then, on succeeding plates, a Willow Grouse, a Sage Grouse (male), Columbia Sharp-tailed Grouse (female), Oregon Ruffed Grouse, Mountain Partridge, and Valley Partridge. All are from mounted birds but from excellent specimens, and with good back-ground effects.— J. A. A.

Giglioli's 'Avifauna Italica.'— As indicated by the full title,¹ this volume of more than 800 pages is a catalogue of the birds known to occur in Italy, numbering 496 species, with their local vernacular names, a statement of their manner of occurrence and distribution in Italy, and a critical examination of their local variations. Italian birds appear to possess an unrivalled number of vernacular designations, the enumeration of which, for the commoner species, forms a large part of the text of the present work.² There is no technical synonymy, and the species are not described; the extended annotations relate wholly to their distribution and manner of occurrence, with mention of their various subspecies, as recognized by modern authors, and in general their condemnation as puerile innovations. In other matters of nomenclature the author is also extremely conservative; tautonymic designations and trinomials are to him an abomination. His nomenclature is strictly binomial, and the forms recognized by him are all full species. He has, indeed, only unsympathetic words for these modern innovations (see especially pp. xiii-xviii of the Introduction, and elsewhere *passim*).— J. A. A.
